2                   **Abstract**

3                 A display box includes a housing for supporting a product, a lid, and a removable hanger  
4                 for locking the lid and housing in a closed position. In the unlocked position, the lid is rotatable  
5                 relative to the housing along an axis of rotation. A set of cooperating locking members are  
6                 provided on the lid, housing and hanger. In one embodiment, the housing includes a first locking  
7                 member in the form of a notch, and the lid includes a second locking member of the same type as  
8                 the housing. The locking hanger includes a pair of corresponding tabs which are sized to fit  
9                 within the notches. In use, the tabs are inserted within the notches and slid into a locked position  
10                to prevent rotation of the lid. To remove the product from within the locked box the hanger must  
11                first be removed from engagement with the lid and housing.
